

Quick Start Guide

Everything you need to get from download to your first opportunity, in under five minutes.

1 Open the app

Unzip the download, open the **app** folder, and double-click **index.html**. It opens in your browser — no install, no account, no internet connection required. It's a single self-contained file, so it works even if you move or copy it on its own.

2 Explore the sample menu

On first launch, a six-dish sample menu is loaded automatically and a short walkthrough appears. Read it, then close it to explore the sample data, or click “Clear it and start blank” to begin with your own menu.

3 Add your dishes

Click **+ Add dish** on the Menu screen. Enter the dish name, selling price, ingredient cost, and monthly units sold. New dishes start as **drafts** — you can edit them freely and they won't affect your numbers yet.

4 Confirm each dish

Once a dish's details are correct, click **Confirm dish**. Confirmed dishes are the ones that get analysed, benchmarked, categorised, and included in your Summary, Profit Map, and Opportunities screens.

5 Read the Summary screen

Switch to the **Summary** tab to see total revenue, gross profit, overall food cost, and how your menu benchmarks average out. Your single biggest opportunity is highlighted here too.

6 Check the Profit Map and Opportunities

The **Profit Map** tab plots every dish by relative sales and margin, sorted into Strong, Grow, Optimise, and Review. The **Opportunities** tab ranks every dish running a higher food cost than your average, with the monthly and annual pound value of fixing it.

7 Export or print

Use **Export CSV** on the Menu screen to save your data, or **Print report** on the Summary screen for a printable copy covering all four screens.

Where your data lives

Everything you enter stays in your browser's local storage on your own device. Nothing is uploaded anywhere. If you clear your browser data, export a CSV backup first.

Nothing showing up right?

If you double-click index.html from *inside* a zip preview window (without extracting first), some file managers open a broken temporary copy. Always fully extract the zip to a folder first, then open index.html from that folder.

Need more detail?

See the **User Guide** in this same folder for a full walkthrough of every screen, every calculation, the CSV format, and the What-if Scenario tools.
