

Quick Start Guide

From download to your first opportunity, in about five minutes.

Version 2.0

1

Open the app

Unzip the download, open the app folder, and double-click index.html. It opens in your browser — no install, no account, no internet connection required. It's a single self-contained file, so it works even if you move or copy it on its own.

If you open it from inside a zip preview window without extracting first, some file managers load a broken temporary copy — always extract fully to a folder first.

2

Load the sample menu

On first launch, click **Try sample menu**. It loads a ready-made seven-dish menu — including one dish deliberately priced below its ingredient cost, so you immediately see how the app flags a loss-making dish. Everything below uses that sample menu, so there's nothing to type yet.

3

Analyse: read the Overview screen

The **Overview** screen leads with your single biggest opportunity, then a KPI strip (revenue, gross profit, food cost, dishes analysed), a Strong / Grow / Optimise / Review / Loss health bar across the whole menu, and a “what deserves attention” priority list underneath.

4

Find an opportunity

Open the **Insights** screen. Every dish has its own card, ranked most urgent first, in plain language — what its numbers mean and, where its food cost is above benchmark, the modelled monthly value of closing that gap. For a faster answer, check **Action plan** instead: it picks the single best next step per dish and lists them in priority order, so you don't have to work it out yourself.

5

Run a scenario

Open the dish behind your biggest opportunity and click **Test a change**. On the **Scenarios** screen, try a different price, ingredient cost or sales volume — individually or together — and see the modelled monthly impact instantly, plus a recommendation and a ranking of which change would matter most. Nothing here touches your actual menu, so there's nothing to undo.

6

Save a version

On the **Menu** screen, scroll to Menu versions and click **Save current version**. This freezes a snapshot of your menu exactly as it stands, so you can come back later — after making real changes — and compare today against that saved point, or restore it if you ever need to.

7

Get a report

Back on the sidebar (desktop width), click **Print report**. It opens your browser's print dialog with a clean, one-page-friendly summary: headline KPIs, your menu health bar, your biggest opportunity, and your top Action plan priorities — ready to print or save as a PDF to share.

Where your data lives

Everything you enter stays in your browser's local storage, on your own device. Nothing is uploaded anywhere. If you plan to clear your browser data or switch devices, export a CSV backup first.

Ready to use your own numbers?

Click **+ Add dish** on the Menu screen instead of the sample menu, or use **Import CSV** if you already have your menu in a spreadsheet. New dishes start as drafts and don't affect your numbers until you click **Confirm dish**.

Need more detail?

See the User Guide in this same folder for a full walkthrough of every screen, every calculation, targets, recipes, Profit control, versions, and the CSV format.
